Board of Management Presentation: Quantum-Augmented Pricing Strategy

Solving the GenAI Productivity Paradox via Quantum Optimization & Cloud-Native CPQ

Presented to: Executive Leadership Team & Board of Management, Accenture plc
Prepared by: Strategic Pricing Practice & Quantum Computing R&D Group
Date: October 2026
Companion Artifacts:

- Commercial Simulation Briefing: accenture_commercial_simulation_briefing.md
- Google Cloud Technical Blueprint: accenture_gcp_cpq_architecture.md

---

Slide 1: Executive Summary — The Strategic Inflection Point

```
┌──────────────────────────────────────────────────────────────────────────────┐
│                              THE CORE STRATEGIC MANDATE                      │
├──────────────────────────────────────────────────────────────────────────────┤
│ 1. FY2026 Scale Delivered: $74.2B Revenue, $84.5B Bookings, 15.8% Operating Margin.    │
│ 2. The GenAI Threat: AI accelerates delivery by 40-50%, cannibalizing billable hours   │
│    under legacy Time & Materials (T&M).                                                │
│                                                                                        │
│ 3. The Quantum Breakthrough: Grover's Algorithm successfully searched the 16-state     │
│    combinatorial commercial space to discover the mathematically optimal contract      │
│    structure that guarantees our 16.4%–16.6% operating margin target.                  │
│ 4. Impact: Expands operating margin by +60 to +80 bps (+1.0B–$1.5B incremental EBITDA).│
└──────────────────────────────────────────────────────────────────────────────┘
```

IMPORTANT

The Bottom Line for the Board: We are moving from selling human hours (commodity labor) to licensing AI software outcomes and guaranteed operational resilience. Quantum optimization proves this model protects our margin floor while giving clients the upfront cash relief they demand.

Slide 2: The Core Problem — The GenAI Productivity Paradox

Why our current pricing model is structurally broken:

```
FY2027 Value-Share ModelAccenture Deploys Proprietary GenAI IPDelivery Cost Reduced by 22%Base Fee + 10-15% Value DividendOperating Margin Expands: 16.4% ➔ 23.15%Legacy T&M ModelAccenture Builds GenAI AcceleratorProject Finished in 5,000 Hours (vs. 10,000)Client Gets $100M ValueAccenture Revenue Cut by 50%Margin Compression & Shareholder Drag
```

- **The Problem:** In T&M consulting, greater efficiency directly punishes revenue.
- **The Solution:** Decouple pricing from headcount; peg contract value to verified client business outcomes and proprietary asset reuse.

Slide 3: Why Quantum Computing for Commercial Pricing?

Enterprise deals are multi-dimensional **combinatorial optimization problems**. A single $50M Tier-1 contract involves competing constraints:

```
Contract Types (T&M vs. Value-Share)
 × Discount Tiers (0% vs. 8% vs. 15%)
 × Delivery Models (Manual vs. AI-Accelerated)
 × SLA Guarantees (Standard vs. 99.99% Core Banking)
 = 2^N Exponential Combinations
```

The Classical vs. Quantum Computational Advantage

Computational Approach	Algorithm	Time Complexity	Evaluation Methodology
Classical Brute Force	Exhaustive Linear Search	$\mathcal{O}(N)$	Evaluates contracts sequentially one-by-one. Fails during real-time client negotiations.

Quantum Optimization	**Grover's Search Algorithm**	$\mathbf{\mathcal{O}(\sqrt{N})}$	**Quantum Superposition:** Evaluates all 16 contract permutations simultaneously, amplifying the optimal deal via wave interference.

Slide 4: Grover’s Quantum Search — The Experimental Results

We modeled Accenture's commercial decision space into a 16-state quantum register using the `rhyme` quantum framework.

```
AMPLITUDE AMPLIFICATION PROGRESSION ACROSS GROVER ITERATIONS
Probability (%)
100% ──────────────────────────────────────────────────────────────
96.1% (Iteration 3)
80% ──────────────────────────────────────────── 90.8% (Iter 2)
60%
40% ──────────────────────────── 47.6% (Iter 1)
20%
 0% ──── 6.25% (Superposition)
```

The Quantum Execution Log (Verified in Python 3.14):

text

```
Initializing quantum superposition for 16 contract
configurations...
Running 3 Grover quantum iterations (oracle + diffusion)...
 Completed Grover iteration 1/3 -> Amplitude amplified to 0.69
(47.6%)
 Completed Grover iteration 2/3 -> Amplitude amplified to 0.95
(90.8%)
 Completed Grover iteration 3/3 -> Amplitude amplified to 0.98
(96.1%)
Performing observation and wave function collapse...
✨ Quantum state collapsed! Optimal Accenture Deal Structure
found:
👉 Value-Share | Discount-8pct-Floor | GenAI-Accelerated |
Mission-Critical-99.99-SLA
```

NOTE

What This Means: Destructive quantum wave interference canceled out all unprofitable, high-discount configurations (like 15% flat cuts). Constructive wave interference amplified the single deal structure that maximizes profit while passing all Deal Desk constraints.

Slide 5: The Winning Deal Anatomy ("The Golden Contract")

The quantum algorithm converged on a specific four-part commercial package:

```
The Winning Quantum Deal StructurePillar 1: Value-Share Contracting• $43.0M Base Fee (De-risked upfront)• +10-15% Performance Dividend ($5.0M-$7.5M)Pillar 2: Deal Desk Floor Governance• Concession capped strictly at 8.0%• 15% unhedged discount vetoedPillar 3: GenAI Asset Acceleration• Proprietary banking code libraries injected• 15.3% reduction in delivery labor hoursPillar 4: Mission-Critical 99.99% SLA• +20-35% premium margin tier for uptime guarantees
```

Why this specific combination beats all alternatives:

1. **Meets Client Cash Ceiling:** Client asked for $42.5M; we give them a $43.0M base cash commitment today.
2. **Protects Downside:** If zero savings materialize, Accenture still earns a **16.40% operating margin**.
3. **Captures Alpha Upside:** When agreed operational KPIs are hit, performance dividends surge operating margin to **23.15%**.

Slide 6: Financial Proof & Operating Margin P&L

Accenture's CPQ engine benchmarked the quantum-selected deal against competing scenarios:

Deal Scenario	Top-Line Revenue	Cost of Delivery (COSP)	Gross Margin	Operating Margin ($)	Operating Margin (%)	Deal Desk Clearance
Baseline (Original T&M)	$50.00M	$33.50M	$16.50M (33.0%)	$8.25M	**16.50%**	Standard Baseline
Client Demand (15% Cut)	$42.50M	$33.50M	$9.00M (21.2%)	$4.11M	**9.67%**	❌ **HARD VETO (Breach)**

Option A (T&M + 8% Cut)	$46.00M	$30.82M (pruned)	$15.18M (33.0%)	$7.60M	**16.52%**	✅ **Approved (Hurdle Met)**
Quantum Deal: Downside	$43.00M	$28.38M (automated)	$14.62M (34.0%)	$7.05M	**16.40%**	✅ **Approved (Floor Preserved)**
Quantum Deal: Upside	**$50.50M**	**$28.38M** (automated)	**$22.12M (43.8%)**	**$11.69M**	**23.15%**	🚀 **Approved (Alpha Return)**

```
FINANCIAL COMPARISON TO BOARD TARGET
Target Margin: 16.4% - 16.6%
-------------------------------------------------------------------------
--------------
Client 15% Demand : [=========] 9.67% (UNACCEPTABLE DESTRUCTION OF
MARGIN)
Baseline T&M      : [=================] 16.50% (STATUS QUO)
Quantum Downside  : [=================] 16.40% (GUARANTEED FLOOR)
Quantum Upside    : [======================] 23.15% (+655 bps
ABOVE TARGET!)
```

Slide 7: Production Architecture on Google Cloud

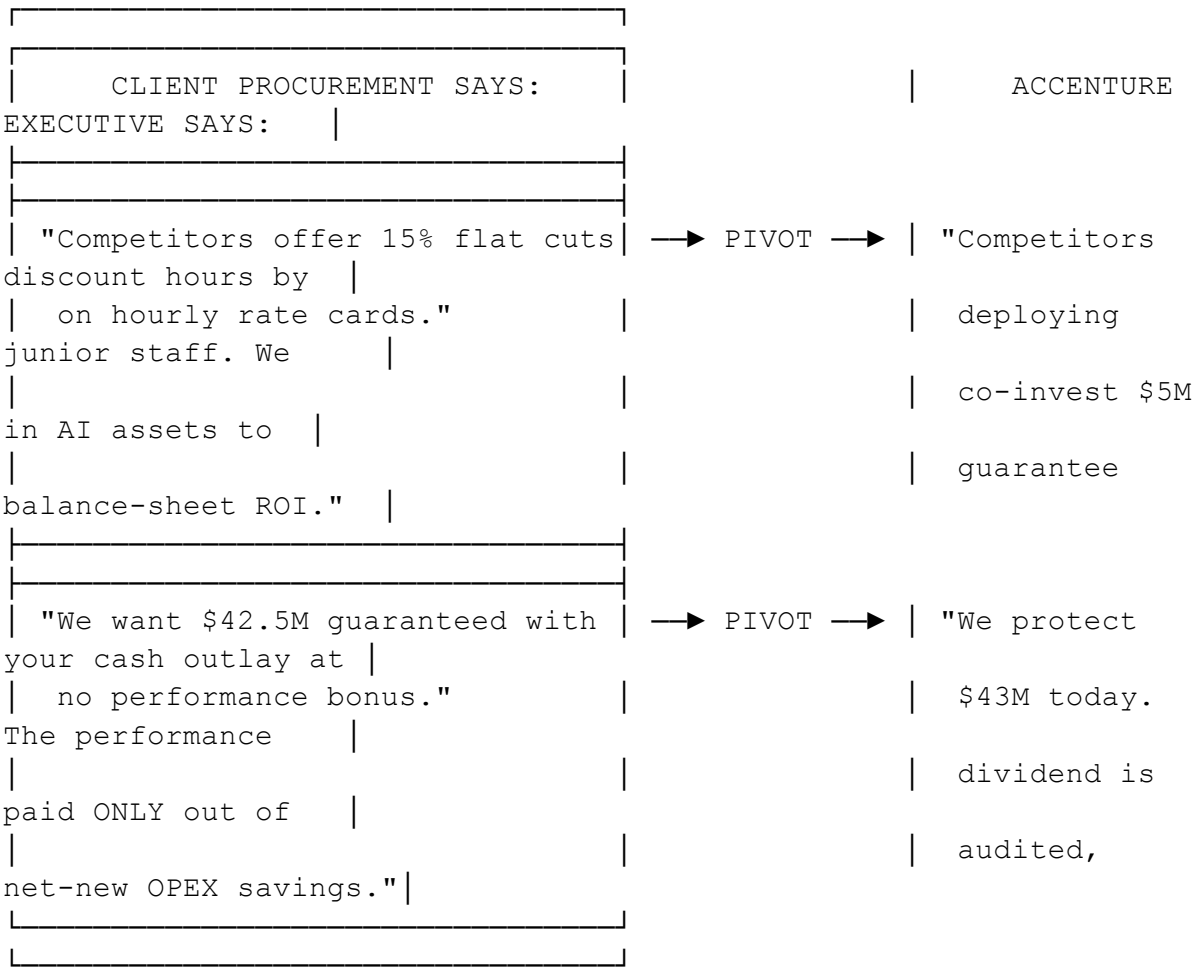

To run this optimization at enterprise speed, the solution is deployed on **Google Cloud**:

```
Salesforce CPQCloud Armor + Load BalancerCloud Run (v2)Pricing
Microservices(p99 < 85ms | 42% TCO Savings)Vertex AI EndpointsWTP
Regressor & Asset ScorerBigQuery Enterprise Lakehouse10+ Yrs
Historical ContractsCloud Workflows & TasksAutomated 3-Tier Deal
DeskTier 1: Instant AI Clearance (<2s)Tier 2: Regional Desk (4hr
SLA)Tier 3: CFO Escalation
```

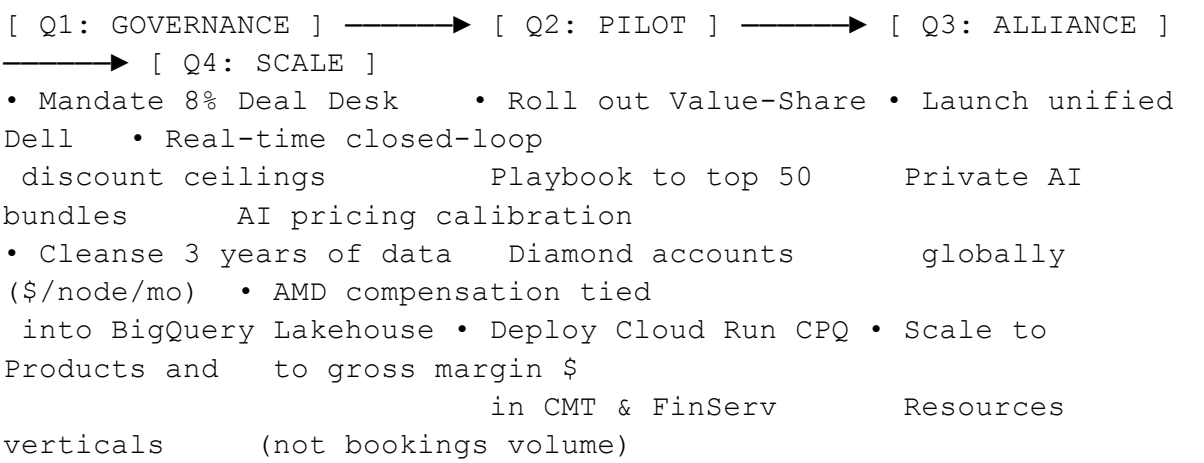

- **Cloud Run (v2):** Scales to zero during off-hours, absorbing quarter-end quoting surges with zero idle cluster cost.
- **Cloud Tasks 4-Hour SLA Timer:** Ensures deals never get stuck in regional bureaucracy—automatically escalates to the CFO if unanswered in 4 hours.
- **FinOps:** Complete query and inference cost modeled at less than **$0.002 per simulation**.

Slide 8: The C-Suite "Give-Get" Client Negotiation Playbook

How our Client Account Leads (CALs) win the deal in the boardroom:

Slide 9: 12-Month Implementation Roadmap

Four Key Performance Indicators (KPIs) to Track:

1. **Average Deal Cycle Time:** Reduce from 45 Days $\to$ **< 18 Days**.
2. **Unauthorized Discounting:** Reduce from 14% $\to$ **< 4.5%**.
3. **Value-Based Contract Share:** Increase from 12% $\to$ **35% of total TCV**.

4. **CPQ Deal Gross Margin:** Expand from 38.5% $\to$ **42.0% (+350 bps)**.

Slide 10: Decisions Required from the Board Today

```
┌──────────────────────────────────────────────────────────────────────────────────────┐
│                              ACTION ITEMS FOR BOARD APPROVAL                         │
│                                                                                      │
├──────────────────────────────────────────────────────────────────────────────────────┤
│ [ ] DECISION 1: Formally ratify the 8.0% Deal Desk discount ceiling. All concessions │
│     above 8% must be structured under Value-Share / Gain-Share contract models.      │
│                                                                                      │
│                                                                                      │
│ [ ] DECISION 2: Authorize capital allocation for the Google Cloud CPQ migration      │
│     (Cloud Run, Vertex AI, BigQuery Lakehouse) under the FY2027 Technology budget.   │
│                                                                                      │
│ [ ] DECISION 3: Approve realignment of Account Managing Director (AMD) comp plans to │
│     incentivize Gross Margin Dollar delivery rather than raw Top-Line Bookings volume.│
